organization in a highly competitive business environment. The philosophy underlying the development of this book is that providing cost accounting information is primarily a logical process, rather than a procedural one. It is most important that students first understand the basic concepts and objectives, and then gain some experience in applying these concepts in different environments. Through this approach, students will be better equipped to deal with the unforeseen situations they will encounter in professional practice or on professional examinations. This philosophy is evident in each chapter, as basic concepts are presented and then illustrated with examples and a wide variety of homework problems. This text is intended for use in undergraduate and graduate courses in cost accounting at both the basic and advanced levels. It provides a complete and concise coverage of topics commonly included in a basic course, with an in-depth coverage of selected topics more appropriate for an advanced course in cost accounting. Modular coverage of these topics permits the instructor to adapt the text to his or her own preferences for course content. Plus, an extremely clear writing style contributes to the ease with which students will comprehend the contents of each chapter. By emphasizing the differing uses for cost accounting information, our intent is to make the student an intelligent provider, user, and interpreter of this information.

experimental and behavioral economics. Featuring contributions presented at the 2017 Computational Methods in Experimental Economics (CMEE) conference, which was held in Lublin, Poland, it merges findings from various domains to present deep insights into topics such as game theory, decision theory, cognitive neuroscience and artificial intelligence. The fields of experimental economics and behavioral economics are rapidly evolving. Modern applications of experimental economics require the integration of know-how from disciplines including economics, computer science, psychology and neuroscience. The use of computer technology enhances researchers' ability to generate and analyze large amounts of data, allowing them to use non-standard methods of data logging for experiments such as cognitive neuronal methods. Experiments are currently being conducted with software that, on the one hand, provides interaction with the people involved in experiments, and on the other helps to accurately record their responses. The goal of the CMEE conference and the papers presented here is to provide the scientific community with essential research on and applications of computer methods in experimental economics. Combining theories, methods and regional case studies, the book offers a valuable resource for all researchers, scholars and policymakers in the areas of experimental and behavioral economics.
