### **Information Systems for Business and Beyond**

This textbook is intended to meet the needs of a first course in accounting information systems at either the undergraduate or graduate level. It may also be used as a review text in second or subsequent courses in this area. A primary objective in writing the seventh edition of the text was to present AIS material that would make students more marketable in today's accounting environment. Recognizing that over 90 percent of accounting systems are licensed rather than

internally custom developed and that the current market demand is for accounting graduates who can install, operate, and audit such systems, this text represents a new paradigm. In contrast to traditional accounting systems textbooks that assume an organization will develop its own accounting system and, therefore, emphasize systems development, this textbook gives students the theoretical foundation and skills they will need to conduct a requirements analysis, search for a commercial solution, and successfully implement the software package selected. In addition to learning the essential AIS concepts, you will see much discussion and many examples of commercial accounting systems software as it is designed and as it should be designed. Another objective in writing this edition was to make the material student friendly. Therefore, the authors took great care in directing their words to the students. Recognizing that this is their first introduction to accounting systems, clear definitions of terms were included and numerous examples and illustrations were incorporated to explain the material. The book consists of fifteen chapters. The first fourteen chapters provide the theoretical and practical foundation for the final chapter on selecting and implementing AIS software. The learning experience will be optimized if all fifteen chapters are covered.

This book contains a collection of research papers on accounting information systems including their strategic role in decision processes, within and between companies. An accounting system is a complex system composed of a mix of strictly interrelated elements such as data, information, human resources, IT tool, accounting models and procedures. Accounting information systems are often considered the instrument by default for accounting automation. This book aims to sketch a clear picture of the current state of AIS research, including design, acceptance and reliance, value-added decision making, interorganizational links, and process improvements. The contributions in this volume emphasize that AIS has grown into a powerful strategic tool. The book provides evidence for this observation by examining a wide range of current issues ranging from theory development in AIS to practical applications of accounting information systems. In particular it focuses on themes of growing interest in the realm of XBRL and Financial Reporting, Management Information Systems, IT/IS Audit and IT/IS Compliance. The book will be of interest to financial and managerial accountants and IT/IS practitioners, including information systems managers and consultants.

Some books focus more on technology topics than basic accounting system topics. Few accounting graduates will apply for jobs to build

As a result, this book has a practitioner emphasis, not a systems development emphasis as do many accounting textbooks. Intended to meet the needs of a first course in accounting information systems at either the undergraduate or graduate level, this textbook may also be used as a review text in second or subsequent courses in this area.

and the proliferation of global enterprises. The potential detriments are rarely accurately, completely, and timely addressed as information system vendors, management consultants, and corporate procurement teams race toward the popularly conceived state of the art. Systems are ballyhooed as continually improving in processing speed, functionality, and capacity. Users of these automated systems may not consider big picture effects, and they may not intelligently consider the conduct risks to their own enterprises by concentrating such global reach and influence at high levels of senior management without dedicating adequate resources to verifying the accuracy, completeness, and timeliness of the information systems. This book considers these risks.
