## **Indian Journal of Chemistry**

A collection of the Nobel Lectures delivered by the prizewinners in chemistry, together with their biographies, portraits and the presentation speeches.

## **Numerical Simulation of an Arc Heated Plasma Process for Diamond Chemical Vapor Deposition**

### **Index of Conference Proceedings**

Hardbound. In addition to the three main themes: chemical reactors, distillation columns, and batch processes this volume also addresses some of the new trends in dynamics and control methodology such as model based predictive control, new methods for identification of dynamic models, nonlinear control theory and the application of neural networks to identification and control. Provides a useful reference source of the major advances in the field.

### **Chemical structures 2**

Magnetic Resonance Imaging (MRI) is one of the most important tools in clinical diagnostics and biomedical research. The number of MRI scanners operating around the world is estimated to be approximately 20,000, and the development of contrast agents, currently used in about a third of the 50 million clinical MRI examinations performed every year, has largely contributed to this significant achievement. This completely revised and extended second edition: Includes new chapters on targeted, responsive, PARACEST and nanoparticle MRI contrast agents. Covers the basic chemistries, MR physics and the most important techniques used by chemists in the characterization of MRI agents from every angle from synthesis to safety considerations. Is written for all of those involved in the development and application of contrast agents in MRI. Presented in colour, it provides readers with true representation and easy interpretation of the images. A word from the Authors: Twelve years after the first edition published, we are convinced that the chemistry of MRI agents has a bright future. By assembling all important information on the design principles and functioning of magnetic resonance imaging probes, this book intends to be a useful tool for both experts and newcomers in the field. We hope that it helps inspire further work in order to create more efficient and specific imaging probes that will allow materializing the dream of seeing even deeper and better inside the living organisms. Reviews of the First Edition: "attempts, for the first time, to review the whole spectrum of involved chemical disciplines in this technique"—Journal of the American Chemical Society "well balanced in its scope and attention to detail a valuable addition to the library of MR scientists"—NMR in Biomedicine

Dimethylsulphide (DMS), emitted by marine phytoplankton, is the second most important source of atmospheric sulphur, after anthropogenic SO<sub>2</sub>. In the atmosphere, DMS is transformed into condensable acidic sulphur products and, through gas-to-particle conversion, it becomes the most important natural source of atmospheric sulphate aerosols. Possible climatic effects have been suggested, linked to the negative radiative forcing due to scattering of solar radiation and especially to modification of cloud albedo over oceans by sulphate aerosol particles. These effects occur in addition to those deriving from the superimposed anthropogenic component of the atmospheric sulphate. Understanding the cycle of DMS in the marine troposphere and its interaction with the aerosol budget and cloud properties has become a key research target in these last years. Our knowledge of the many processes involved is still fragmentary, however. This book, which updates the state of our comprehension of the marine DMS cycle with special regard to its climatic impact, will be of interest to marine biologists, atmospheric chemists, aerosol physicists and climatologists, and to scientists

concerned with changes in the Earth's climate.

In the course of his distinguished career spanning about half a century, George A Olah, winner of the 1994 Nobel Prize for Chemistry, has been exceedingly prolific and has published more than 1000 scientific papers and 15 books and holds more than 100 patents. This invaluable volume contains about 250 papers selected for their breadth and current importance. Contents: Volume 1: Early Studies Electrophilic Aromatic Substitution Friedel-Crafts Chemistry Stable (Persistent), Long Lived Carbocations: General Aspects Trivalent Alkyl (Cycloalkyl) Cations (Carbenium Ions)  $\pi$ - and  $\pi\sigma$ -Delocalized Carbocations Heteroatom and Metal Substituted Carbocations Carbocations Aromatic and Homoaromatic Cations and Dications Five and Higher Coordinate (Nonclassical) Carbonium Ions: Controversy and Significance Magic Acid and Superacid Chemistry Solid Superacid Catalysis From Kekulé's Four-Valent Carbon to Higher Coordinate Hypercarbon Electrophilic Chemistry of Saturated Hydrocarbons Onium Ions: General Aspects Volume 2: Oxonium, Sulfonium, Selenonium and Telluronium Ions Azonium Ions Halonium Ions Miscellaneous Onium Ions Gtonic Onium Di(Poly)cations and Superelectrophilic Activation Synthetic Reagents, Methods and Reactions Oxygenation and Sulfuration Nitration and Nitrosation Chemistry Organofluorine Chemistry Organometallic Chemistry Polymer Chemistry New Approaches to Future of Hydrocarbon Needs Miscellaneous Studies keywords:

Carbohydrate Chemistry provides review coverage of all publications relevant to the chemistry of monosaccharides and oligosaccharides in a given year. The amount of research in this field appearing in the organic chemical literature is increasing because of the enhanced importance of the subject, especially in areas of medicinal chemistry and biology. In no part of the field is this more apparent than in the synthesis of oligosaccharides required by scientists working in glycobiology. Glycomedicinal chemistry and its reliance on carbohydrate synthesis is now very well established, for example, by the preparation of specific carbohydrate-based antigens, especially cancer-specific oligosaccharides and glycoconjugates. Coverage of topics such as nucleosides, amino-sugars, alditols

and cyclitols also covers much research of relevance to biological and medicinal chemistry. Each volume of the series brings together references to all published work in given areas of the subject and serves as a comprehensive database for the active research chemist. Specialist Periodical Reports provide systematic and detailed review coverage in major areas of chemical research. Compiled by teams of leading authorities in the relevant subject areas, the series creates a unique service for the active research chemist, with regular, in-depth accounts of progress in particular fields of chemistry. Subject coverage within different volumes of a given title is similar and publication is on an annual or biennial basis.
