Practice Book for Conceptual Physical Science Explorations

Anti-Oppressive Social Work Practice is the first text to fully integrate concepts of anti-oppressive practice with generalist practice course content. This comprehensive approach introduces concepts of social justice and offers detailed insight into how those principles intersect with the practice of social work at the micro, mezzo, and macro levels. The book covers ethics, values, and social work theory, and discusses the fundamentals of working with individuals, families, groups, organizations, and communities. The book also highlights policy and social movement activism and practice within a global context. Maintaining an integrative approach throughout, authors Karen Morgaine and Moshoula Capous-Desyllas effectively bridge the gap between anti-oppressive principles and practice, and offer a practical, comprehensive solution to schools approaching reaccreditation under the mandated CSWE Standards. ? “Provides an important step in the ongoing evolution of generalist practice in social work. It continues a rich tradition [that] challenges the profession to become more and more explicit about the revolutionary aspect of practice.” —Christian Itin, Metropolitan State University of Denver “Offers a fresh perspective of social work practice interventions.” —Terrence Allen, North Carolina Central University

Dialogues on Agential Realism is built up around dialogues with key scholars in the field: Magdalena Górska, Astrid Schrader, Elizabeth de Freitas, Ericka Johnson and Karen Barad. The book investigates agential realist-inspired research practices and provides illustrations of what response-able knowledge production may involve. Based on thorough readings of the scholars' work, careful dialogues concerning the challenges, messiness, thrill and inventiveness of research processes are brought to the fore. The dialogues with Górska, Schrader, de Freitas and Johnson were based on specific research projects, which drew inspiration from agential realist theory, in combination with the ideas of other thinkers. The dialogue with Barad focuses on the continuous development of agential realism. In addition, the book consists of a chapter that introduces agential realism and a closing chapter focusing on some of the main insights agential realism has to offer in relation research practices. The book offers new entry points to agential realism and the conduct of research. It may vitalize methodological prudence and creativity and spark new and previously unimagined ways of thinking and doing research. As such, it will be an essential resource to both newcomers and scholars and students who are already familiar with the theory of agential realism.

First released in the Spring of 1999, *How People Learn* has been expanded to show how the theories and insights from the original book can translate into actions and practice, now making a real connection between classroom activities and learning behavior. This edition includes far-reaching suggestions for research that could increase the impact that classroom teaching has on actual learning. Like the original edition, this book offers exciting new research about the mind and the brain that provides answers to a number of compelling questions. When do infants begin to learn? How do experts learn and how is this different from non-experts? What can teachers and schools do--with curricula, classroom settings, and teaching methods--to help children learn most effectively? New evidence from many branches of science has significantly added to our understanding of what it means to know, from the neural processes that occur during learning to the influence of

culture on what people see and absorb. *How People Learn* examines these findings and their implications for what we teach, how we teach it, and how we assess what our children learn. The book uses exemplary teaching to illustrate how approaches based on what we now know result in in-depth learning. This new knowledge calls into question concepts and practices firmly entrenched in our current education system. Topics include: How learning actually changes the physical structure of the brain. How existing knowledge affects what people notice and how they learn. What the thought processes of experts tell us about how to teach. The amazing learning potential of infants. The relationship of classroom learning and everyday settings of community and workplace. Learning needs and opportunities for teachers. A realistic look at the role of technology in education.

The Second Edition of *Research Methods in Practice: Strategies for Description and Causation* sets an entirely new standard for presenting and learning research methods. The perspective gained from this text makes it a truly necessary tool for such applied disciplines as public affairs and administration, public policy, psychology, urban affairs, education, sociology, social work, business, public health, political science, economics, communications and criminal justice. Imbued with a deep commitment to make social and policy research methods accessible and meaningful, the Second Edition of *Research Methods in Practice: Strategies for*

Description and Causation compels and inspires students to truly grasp the logic—and limits—of the latest research appearing in academic journals, government reports, and the media. Authors Dahlia K. Remler and Gregg G. Van Ryzin cover the most pertinent issues and methods, emphasizing the critical interpretation and practical application of research findings. Both causation and description—and the distinction between them—are emphasized and maintained thematically throughout the text. Concepts are taught through in-depth examples, such as “Fighting Malaria in Kenya,” “The U.S. Poverty Measure,” “The Fallout from Hurricane Katrina,” “Family Dinners and Teenage Substance Abuse,” and “The Effect of Poverty on Mental Health.” The realistic trade-offs, uncertainties, habits, and excitement of the research experience come through on every page. “This is the best text available for teaching students the fundamentals of research design and statistics, and for introducing them to the difficulties inherent in evaluation research and causal inference.” —Dave E. Marcotte, University of Maryland, Baltimore County

Cengage Learning is pleased to announce the publication of Debora Katz’s groundbreaking calculus-based physics program, PHYSICS FOR SCIENTISTS AND ENGINEERS: FOUNDATIONS AND CONNECTIONS. The author’s one-of-a-kind case study approach enables students to connect mathematical formalism and physics

concepts in a modern, interactive way. By leveraging physics education research (PER) best practices and her extensive classroom experience, Debora Katz addresses the areas students struggle with the most: linking physics to the real world, overcoming common preconceptions, and connecting the concept being taught and the mathematical steps to follow. How Dr. Katz deals with these challenges—with case studies, student dialogues, and detailed two-column examples—distinguishes this text from any other on the market and will assist you in taking your students “beyond the quantitative.” Important Notice: Media content referenced within the product description or the product text may not be available in the ebook version.

Systems Engineering: Principles And Practice

This book introduces machine learning methods in finance. It presents a unified treatment of machine learning and various statistical and computational disciplines in quantitative finance, such as financial econometrics and discrete time stochastic control, with an emphasis on how theory and hypothesis tests inform the choice of algorithm for financial data modeling and decision making. With the trend towards increasing computational resources and larger datasets, machine learning has grown into an important skillset for the finance industry. This book is written for advanced graduate students and academics in financial econometrics, mathematical finance and applied statistics, in addition to quants and data scientists in the field of quantitative finance. Machine Learning in Finance: From Theory to Practice is divided into three parts, each part covering theory and applications. The first presents supervised learning for cross-sectional data from both a Bayesian and frequentist perspective. The more advanced material places a firm emphasis on neural networks, including deep learning, as well as Gaussian

processes, with examples in investment management and derivative modeling. The second part presents supervised learning for time series data, arguably the most common data type used in finance with examples in trading, stochastic volatility and fixed income modeling. Finally, the third part presents reinforcement learning and its applications in trading, investment and wealth management. Python code examples are provided to support the readers' understanding of the methodologies and applications. The book also includes more than 80 mathematical and programming exercises, with worked solutions available to instructors. As a bridge to research in this emergent field, the final chapter presents the frontiers of machine learning in finance from a researcher's perspective, highlighting how many well-known concepts in statistical physics are likely to emerge as important methodologies for machine learning in finance.

Science, engineering, and technology permeate nearly every facet of modern life and hold the key to solving many of humanity's most pressing current and future challenges. The United States' position in the global economy is declining, in part because U.S. workers lack fundamental knowledge in these fields. To address the critical issues of U.S. competitiveness and to better prepare the workforce, A Framework for K-12 Science Education proposes a new approach to K-12 science education that will capture students' interest and provide them with the necessary foundational knowledge in the field. A Framework for K-12 Science Education

outlines a broad set of expectations for students in science and engineering in grades K-12. These expectations will inform the development of new standards for K-12 science education and, subsequently, revisions to curriculum, instruction, assessment, and professional development for educators. This book identifies three dimensions that convey the core ideas and practices around which science and engineering education in these grades should be built. These three dimensions are: crosscutting concepts that unify the study of science through their common application across science and engineering; scientific and engineering practices; and disciplinary core ideas in the physical sciences, life sciences, and earth and space sciences and for engineering, technology, and the applications of science. The overarching goal is for all high school graduates to have sufficient knowledge of science and engineering to engage in public discussions on science-related issues, be careful consumers of scientific and technical information, and enter the careers of their choice. A Framework for K-12 Science Education is the first step in a process that can inform state-level decisions and achieve a research-grounded basis for improving science instruction and learning across the country. The book will guide standards developers, teachers, curriculum designers, assessment developers, state and district science administrators, and educators who teach science in informal environments.
