### **Land Rover Discovery, Defender & Range Rover**

This book is both an historic and nostalgic look at the role of the Land Rover in the emergency services over the last 70 years. Land Rover products have been used by the emergency services almost from the moment the first Land Rover left the factory in 1948. Their agility and size made them an immediate hit with fire services, where they initially became popular as factory fire tenders. Their cross-country ability and versatility then attracted police forces, especially outside Britain, and when long-wheelbase models

provided extra space, they also became favourites for ambulance conversions. Some emergency-service conversions required very little adaptation, and were carried out in the workshops of the end-users. Others – such as six-wheel Range Rover fire tenders – required major alterations from the factory-standard vehicle. Meanwhile, specialist companies developed dedicated ambulance and fire tender bodywork, creating a fascinating variety of different types. Some of these conversions, such as police patrol vehicles, went on to become part of the background to everyday life. Others are much less well known, and have their own special interest. All of them help to illustrate the versatility and adaptability of Land Rovers and their more modern SUV siblings. Land Rover Emergency Vehicles will interest Land Rover enthusiasts and emergency-vehicle enthusiasts alike, and many of the types illustrated will evoke nostalgic memories of these vehicles in their heyday.

### **Land Rover Discovery Model Years Workshop Manual**

Today, satellite navigation offers convenient alternative to terrestrial and stellar navigation methods that is not only ubiquitous and easy to operate but also available day and night. The radio navigation technology, first appeared in the 1930s and matured in the 1940s, did not take off until the late 1960s and 1970s with the launch of the first navigation satellites by the US Naval and Air Forces, resulting from the NAVSTAR GPS program. The end user navigation equipment, bulky and expensive at

the beginning, did not emerge until the microprocessor became viable during the late 1970s. Now-a-day three other global navigation satellite systems are fully or partially operational: the Russian GLONASS, the European Union Galileo, and the Chinese BeiDou. Where does the future lie? Probably in a network of global satellite navigation systems, with increase in satellite coverage and improved accuracy, integrity, and reliability, as these systems further mature. End user equipment will continue to be smaller, more accurate and cheaper. Yet in many respects, satellite navigation systems owe most to the old-time stellar navigation, by keeping man look up to the sky for help.
