Recognizing the need for improved control measures in the manufacturing process of highly sensitized semiconductor technology, this practical reference provides in-depth and advanced treatment on the origins, procedures, and disposal of a variety of contaminants. It uses contemporary examples based on the latest hardware and processing apparatus to illustrate previously unavailable results and insights along with experimental and theoretical developments. Ensures the proper methods necessary to meet the standards established in the 1997 National Technology Roadmap for Semiconductors (NTRS)! Summarizing up-to-date control practices in the industry, Contamination-Free Manufacturing for Semiconductors and Other Precision Products: Details the physics and chemistry behind the mechanisms leading to contamination-induced failures Considers particles and molecular contaminants, including the entire spectrum of mass-based

contaminants Outlines primary contamination problems and target control levels Reveals and offers solutions to inadequate areas of measurement capability and control technology Clarifies significant problems and decisions facing the industry by analyzing NTRS standards and contamination mechanisms Containing over 700 literature references, drawings, photographs, equations, and tables, Contamination-Free Manufacturing for Semiconductors and Other Precision Products is an essential reference for electrical and electronics, instrumentation, process, manufacturing, development, contamination control and quality engineers; physicists; and upper-level undergraduate and graduate students in these disciplines.

Working Regions focuses on policy aimed at building sustainable and resilient regional economies in the wake of the global recession. Using examples of four 'working regions' — regions where research and design functions and manufacturing still coexist in the same cities — the book argues for a new approach to regional economic development. It does this by highlighting policies that foster innovation and manufacturing in small firms, focus research centers on pushing innovation down the supply chain, and support dynamic, design-driven firm networks. This book traces several key themes underlying the core proposition that for a region to work, it has to link research and manufacturing activities — namely, innovation and production — in the same place. Among the topics discussed in this volume are the issues of how the location of research and development infrastructure produces a clear role of the state in innovation and production systems, and how policy emphasis on pre-production processes in the 1990s has obscured the financialization of intellectual property. Throughout the book, the author draws on examples from diverse industries, including the medical devices industry and the US photonics industry, in order to illustrate the different themes of working regions and the various institutional models operating in various countries and regions.
